

What if

you found cancer early
enough to make a difference

How the Galleri® test works

Through a simple blood draw, the Galleri test looks at DNA in your blood to determine if any of it may have come from cancer cells.

The most important cancer is the one that you or your loved one may have—and beating it starts with knowing you have it.

Introducing the Galleri test

The Galleri multi-cancer early detection test detects more than 50 types of cancer through a simple blood draw. Offering the benefits of:

Early cancer detection

Detects many cancers that are not commonly screened for today, to allow for earlier treatment.

Testing with ease

Can be easily incorporated into a routine healthcare visit.

Actionable results

If a cancer signal is found, the results can point to where in the body the cancer is coming from with high accuracy to help your healthcare provider guide your next steps.

of cancer deaths are caused by cancers not commonly screened for.

It is time to look at cancer more broadly, in addition to the 5 cancers that are routinely screened.

A multi-cancer early detection test can detect many cancers at once to improve the chance of finding cancer early.

Who can benefit?

The Galleri test is recommended for use in adults with an elevated risk for cancer, such as those aged **50 or older**.

The Galleri test is intended to be **used in addition to, and not replace, other cancer screening tests** your healthcare provider recommends.

Understanding the results

The Galleri test looks for signals present in the blood that may be associated with cancer at the time of your blood draw.

There are two possible results from the Galleri test:

⊖ Cancer Signal NOT Detected

This means that no cancer signal was found; however, not all cancers can be detected by the Galleri test. Be sure to continue with routine recommended cancer screening tests.

⊕ Cancer Signal Detected

This means that there is a suspicion of cancer. Your healthcare provider will discuss appropriate follow-up tests to confirm if cancer is present.

Important Safety Information: The Galleri test does not detect all cancers and should be used in addition to routine cancer screening tests. Results should be interpreted by a healthcare provider. A "cancer signal not detected" result does not rule out cancer. A "cancer signal detected" result requires confirmatory diagnostic evaluation (e.g. imaging), and if cancer is not confirmed, it may not be present, may not be detectable by diagnostic follow-up testing, or may be located in a different part of the body. False-positive and false-negative test results do occur. Rx only.
